Notes: \*p < 0.05, \*\*p < 0.01, \*\*\*p < 0.001;

(1) Regression uses ordinary least squares (OLS) for panel data. All regressions control for location i.e. local government area (LGA) fixed effects. In columns 1 to 8 Conley standard errors that account for spatial correlation in the data are used (Conley 1999; 2008).

(2) CT in CT villages = 1 if household was randomly assigned to receive cash transfers in a cash transfer program village; NCT in CT villages = 1 if household was randomly assigned to receive no cash transfers in program villages (non-beneficiaries in treatment villages); and Pure Control = 1 if household did not receive cash transfers in a non-program village where no cash transfers were ever paid (reference group in the regression). Midline and Endline are time fixed effects.

(3) Sample in Table F3 is a balanced panel that includes all ultra-poor households that were interviewed at baseline, midline and endline. Primary female in the household is the respondent.
